

$$x_1 = z_1, \qquad x_2 = z_2 \exp(s(z_1)) + t(z_1)$$

$$s(z_1) = 0.45\tanh(z_1), \quad t(z_1) = 0.65\sin(2z_1), \qquad \log|\det Dg(z)| = s(z_1)$$

The first coordinate stays fixed. The Jacobian is triangular: its diagonal is $1, \exp(s(z_1))$.
